COMPUTER VISION

Bits & Atoms IV

COMPUTER VISION

“Computer vision is a field of artificial intelligence (AI) that enables computers and systems to derive meaningful information from digital images, videos and other visual inputs”

https://en.wikipedia.org/wiki/Computer_vision

Why is computer vision relevant for spatial interaction?

- Automatic analysis/action
- Contextual information
- Understanding of 3D space on 2d projection

COMPUTER VISION

COMPUTER VISION

To get the most out of image data, we need computers to “see” an image and understand the content.

COMPUTER VISION

A person can describe the content of a photograph they have seen once.

A person can summarise a video that they have only seen once.

A person can recognise a face that they have only seen once before.

**This is a trivial problem for a human,
but not for a machine.**

SCIENCE

ADVANCED DRIVER ASSISTANCE

SECURITY/BEHAVIOUR RECOGNITION

FACIAL RECOGNITION

FACIAL RECOGNITION

- **Biometric vulnerabilities** – those that occur in the algorithm of face detection, signature generation and liveness verification
- **Environmental vulnerabilities** – those that result from running the algorithm on the user's end device
- **API vulnerabilities** – those that result from the modification of communication between the user and the identity verification server.

INTERACTION DESIGN

CV TOOLS

Bits & Atoms IV

COMPUTER VISION

Many popular computer vision applications involve trying to recognise things in video or image.

COMPUTER VISION

Object Classification: Broad category of the objects

Object Identification: Type of the objects

Object Verification: Are the objects visible at all?

Object Detection: Position of the objects

Object Landmark Detection: Key points for the objects

Object Segmentation: Pixels belonging to the objects

Object Recognition: Are the given objects in the image?

width * height = pixels

Image source

IMAGE

let index = x + y * width

IMAGE

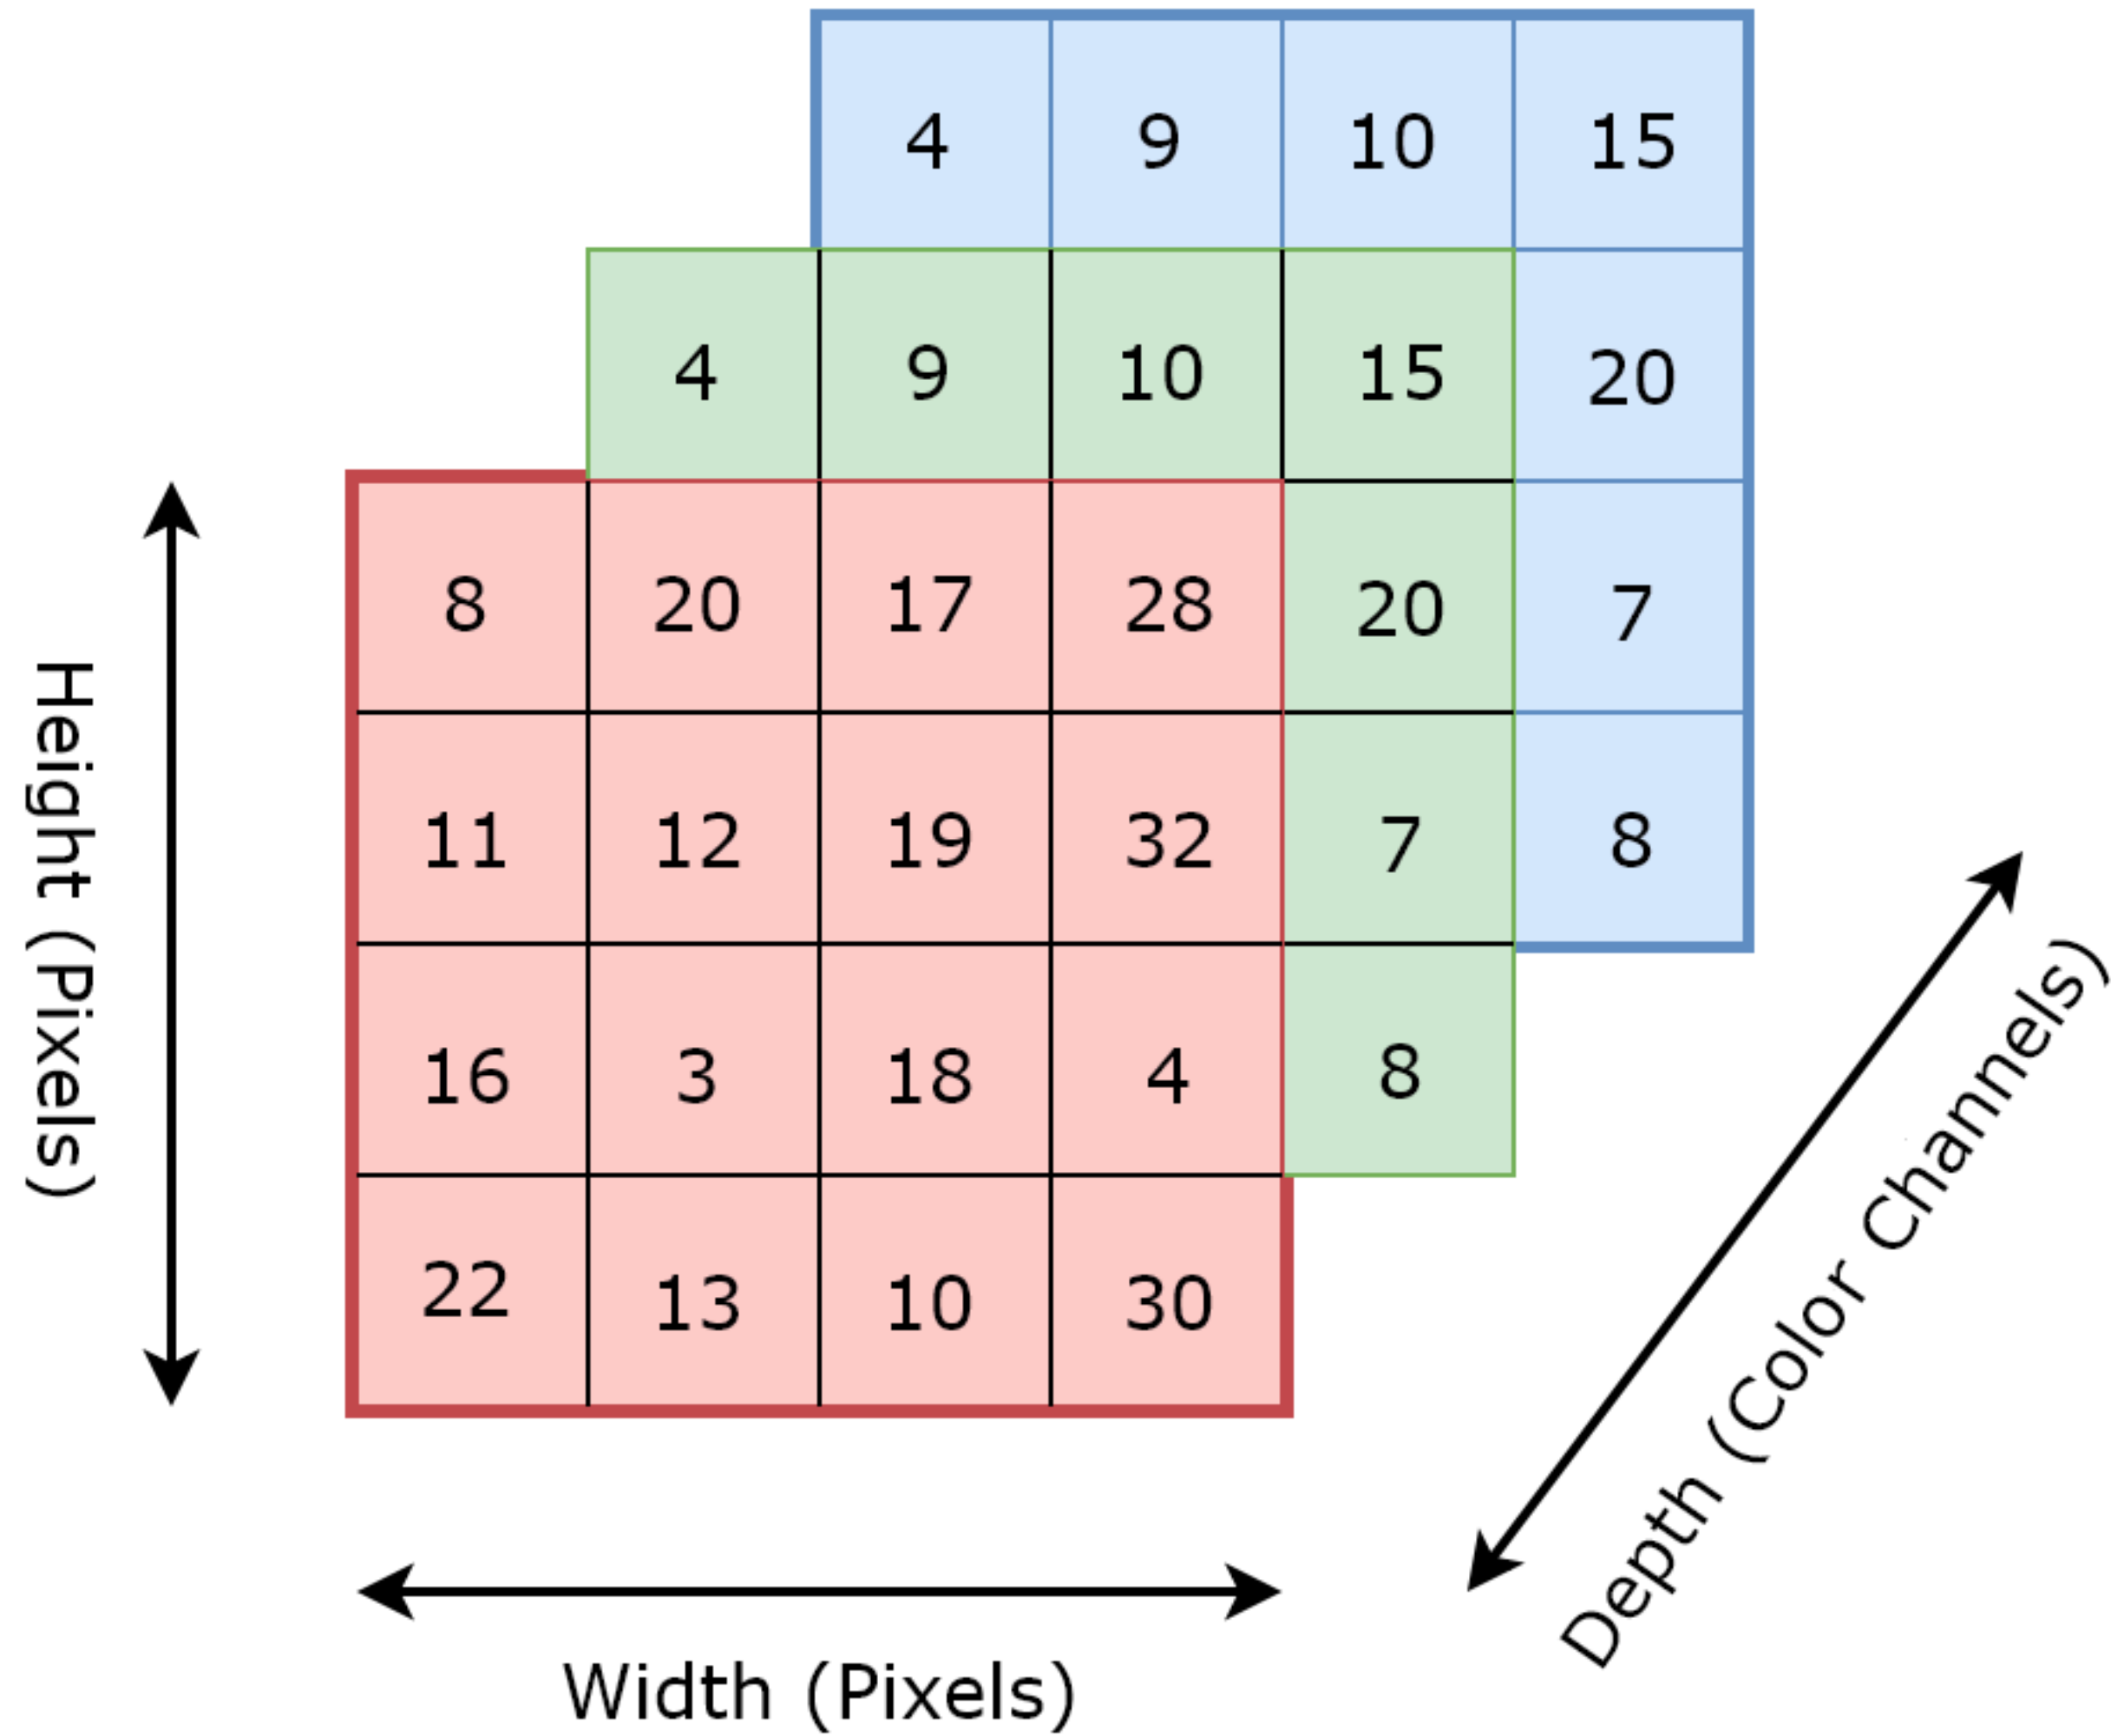

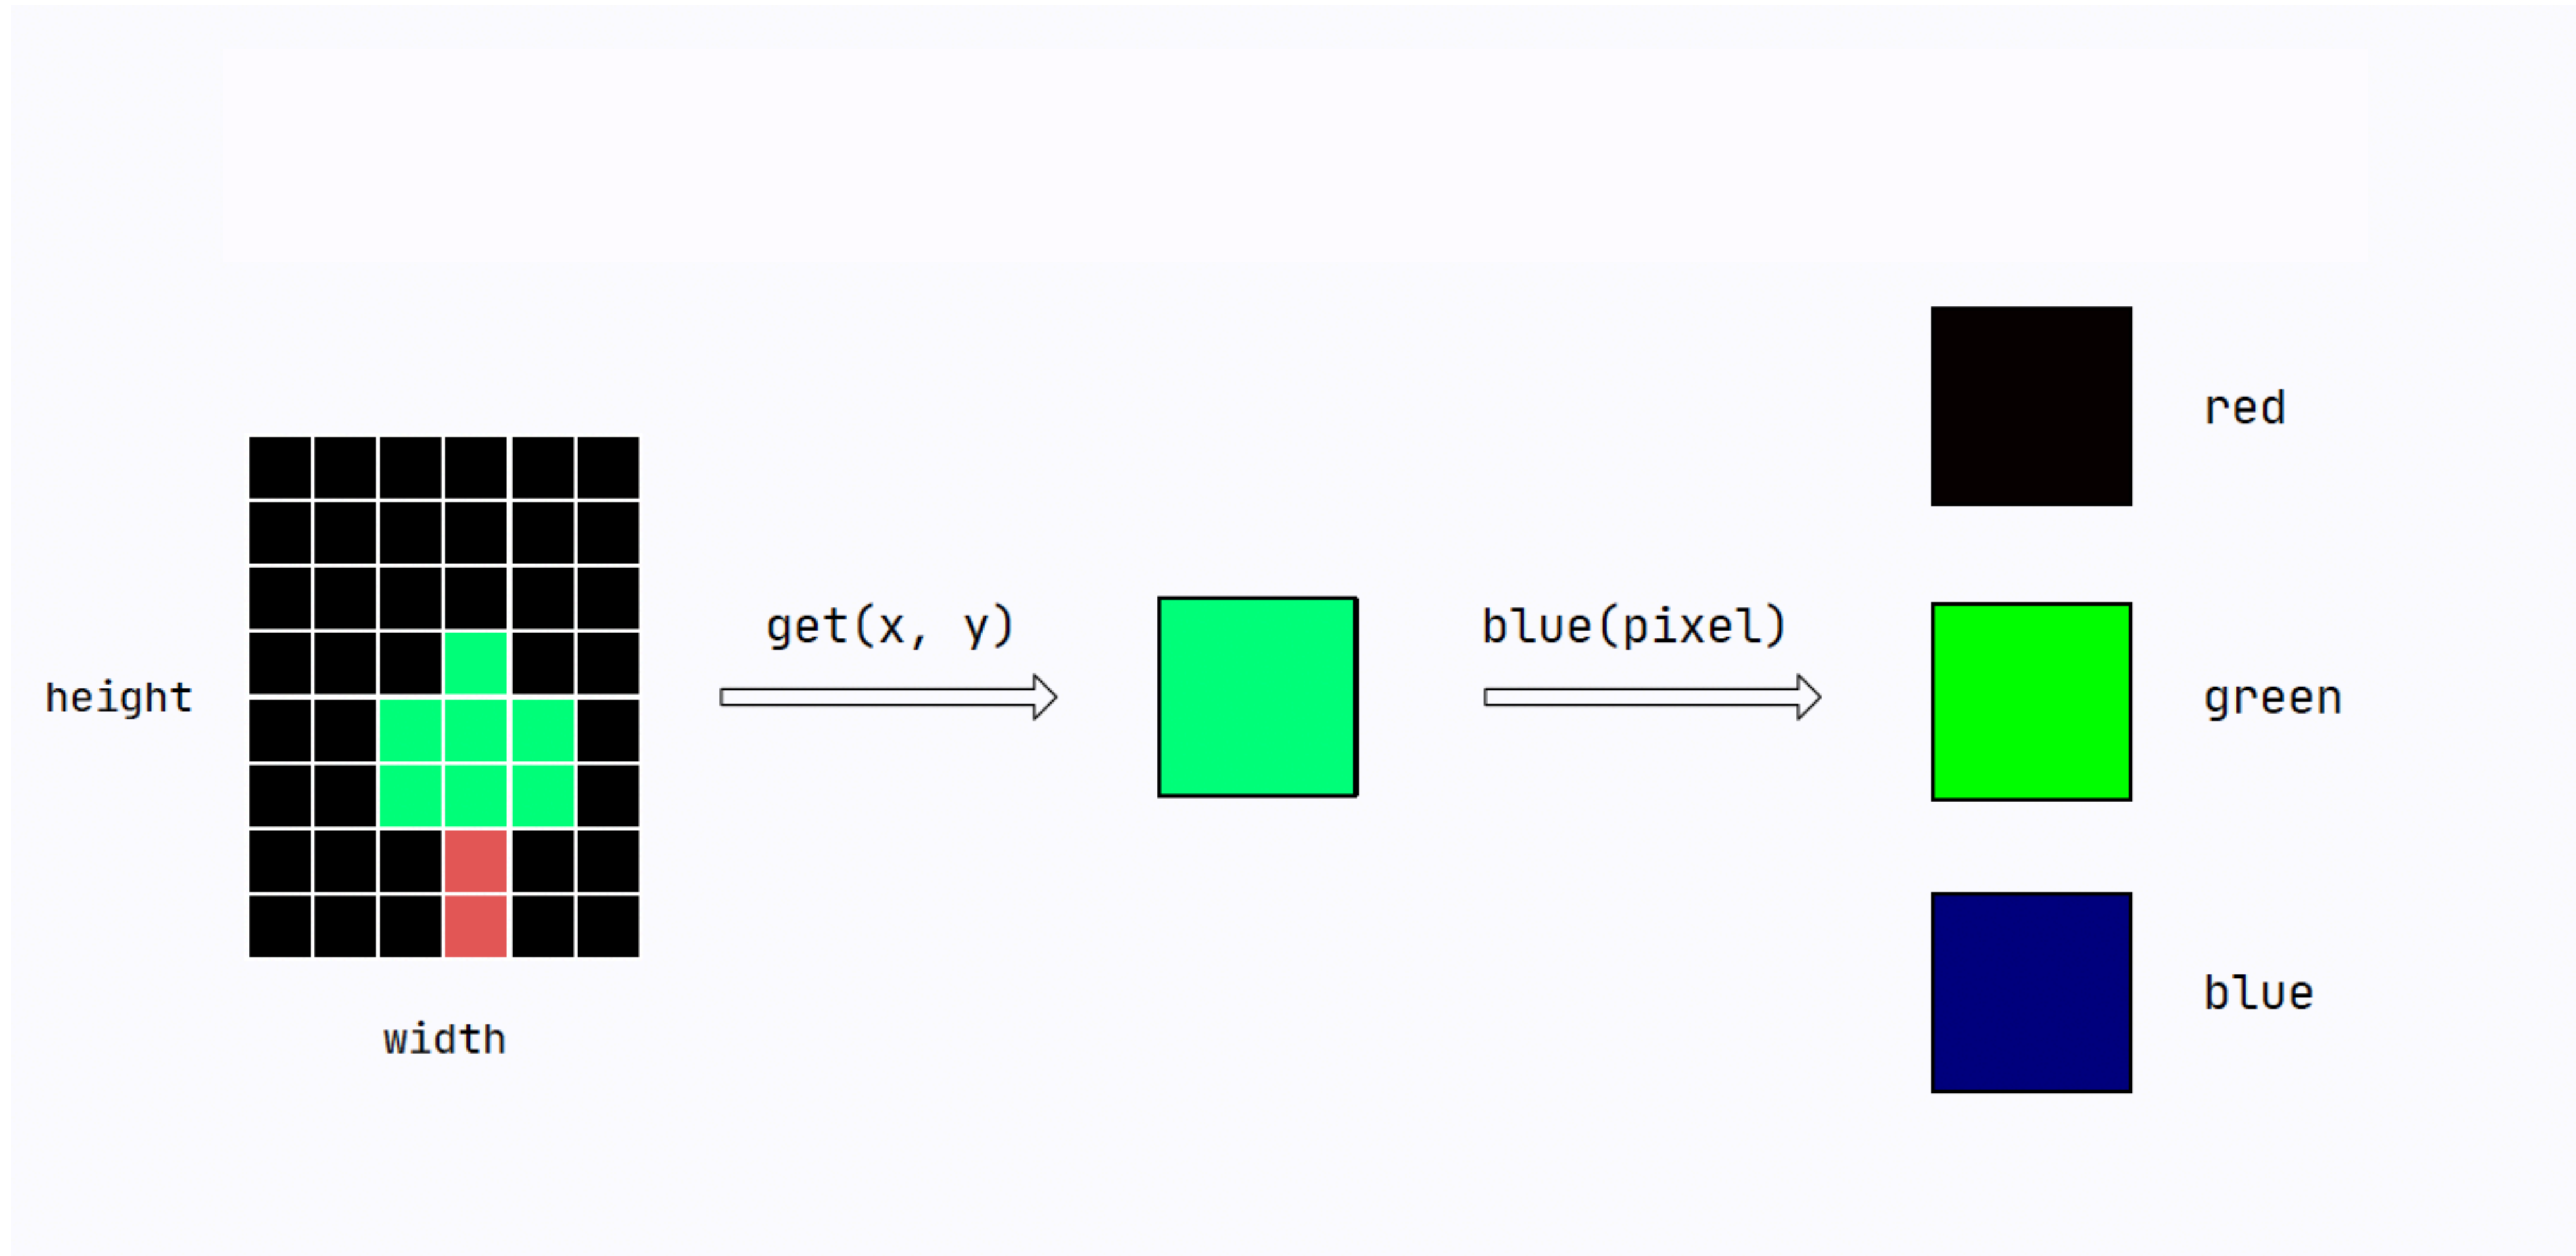

Image source

IMAGE

The memory used to store images is called the video buffer or frame buffer.

Direct access to the screen's frame buffer is pretty unusual on modern computers, and high level libraries like p5.js don't (can't) provide it.

IMAGE

IMAGE

```
Let pixel = img.get(x, y);
```

```
Let r = red(pixel);
```

```
Let g = green(pixel);
```

```
Let b = blue(pixel);
```

```
Let h = hue(pixel);
```

```
Let s = saturation(pixel);
```

```
Let b = brightness(pixel);
```

```
img.set(x, y, color(0))
```

IMAGE

```
// getRGBA()  
// find the RGBA values of the pixel at `x`, `y` in the pixel array of `img`  
// unlike get() this functions only supports getting a single pixel  
// it also doesn't do any bounds checking or other checks  
  
function getRGBA(img, x, y) {  
  const i = (x + y * img.width) * 4;  
  return [  
    img.pixels[i],      //R  
    img.pixels[i + 1], //G  
    img.pixels[i + 2], //B  
    img.pixels[i + 3], //A  
  ];  
}
```

IMAGE

```
// setRGBA()  
// set the RGBA values of the pixel at `x`, `y` in the pixel array of `img`  
// unlike set() this functions only supports setting a single pixel  
  
function setRGBA(img, x, y, c) {  
  const i = (x + y * img.width) * 4;  
  
  img.pixels[i]      = c[0];  
  img.pixels[i + 1] = c[1];  
  img.pixels[i + 2] = c[2];  
  img.pixels[i + 3] = c[3];  
}
```

EXERCISE 1

*In ComputerVision/
Exercise_01*

Using `loadPixels()`
mark the position of
the moon with a red
circle.

EXERCISE 1

Extract the position
from the brightest
pixel in the image
using *brightness()*

EXERCISE 1

Finding the brightest value is quite difficult

- Webcams use auto exposure
- Various noise removal algorithms behind

EXERCISE 2

*In ComputerVision/
Exercise_02*

Find the average RGB value of video stream and represent it as a circle in the middle of the canvas.

Make the size of the circle bigger or smaller depending on the brightness.
